NPA2020-DE

23 – 25 GHz GaN 8 W Power Amplifier

Product Description

The Nxbeam NPA2020-DE is a K-band high power amplifier MMIC fabricated in 0.2um GaN HEMT on SiC. This part is ideally suited for satellite communication, mobile communication, and radar applications. The MMIC operates from 23 to 25 GHz and provides an average of 8 W of saturated output power, 33% PAE, and a linear gain of 17 dB.

The NPA2020-DE comes in die form with RF input and output matched to 50 Ω with DC blocking capacitors for easy system integration. The HEMT devices are fully passivated for reliable operation. Bond pad and backside metallization are Au-based for compatibility with eutectic die attachment methods.

Assembly Process

- This product has gold backside metallization and can be mounted using either a conductive epoxy or AuSn attachment.
- Nxbeam recommends the use of AuSn attachment due to the high-power level of this product.
- Maximum recommended temperature during die attachment is 320 °C for 30 seconds.
- This product contains metal air bridges so caution should be taken when handling the die to avoid damage.

Bias Information

The NPA2020-DE can be biased from either top or bottom of the chip or both sides.

Bias-up Procedure:
1.) It is recommended that voltage and current limits are set on the voltage supply's prior to biasing the product.
2.) Ensure power supplies are properly grounded to the product test fixture.
3.) Apply negative gate voltage (-6 V) to ensure all devices are pinched off.
4.) Gradually increase the drain bias voltage to the desired bias level but not to exceed the maximum voltage of 28 V.
5.) Gradually increase the gate voltage while monitoring the drain current until the desired drain current is achieved.
6.) Apply RF signal.

Bias-down Procedure:
1.) Turn off RF signal.
2.) Gradually decrease the gate voltage down to -6 V.
3.) Gradually decrease the drain voltage down to 0 V.
4.) Gradually increase gate voltage to 0 V.
5.) Turn off supply voltages
